

DESCRIPTION OF PRODUCT

Salt Communications provides organisations with an encrypted communications system with centralised control. Salt Communications product provides secure voice, messaging, conference calling, video calling, broadcasting and image or file transfers for mobile workers. Broadcast channels allow controlled and compliant communications with large and small groups. Used for Incident Response notifications and updates. Integratable into internal systems to allow sensitive information to be securely pushed to selected personnel.

VALUE TO TARGETED AUDIENCE

Salt Communications offers a trusted and validated solution which brings security, privacy, compliance, management, control and visibility to internal communications. A fast and effective secure alternative to replace popular consumer apps being used to send sensitive information. Salt Communications provides full control to the organisation by allowing them to invite trusted users to their closed network and therefore reducing the risk of hacks and leaks.

OBJECTIVES

- Secure communications with messaging and group chat capabilities, as well as 1-to-1 and conference calls.
- Keep key personnel informed by pushing out real-time alerts to groups of users within an organisation. Secure Message Broadcasting allows organisations to send messages, share images & documents as well as assign the level of severity to an alert.
- Protect sensitive data by setting retention policies to ensure that information is removed from devices after a certain time.
- Leverage the full capabilities of a closed private network by deploying within dedicated government owned 4G / LTE networks with no Internet access.
- Increase productivity and keep information private by integrating with other trusted systems to enable sensitive material to be securely shared with mobile workers.
- Provide peace of mind to risk sensitive commercial and government customers through continuous validation of the system's security and architecture by independent security analysts.
- Remain compliant by allowing select organisations to retain a copy of communications for evidential purposes, if required.
- Manage access to sensitive provisioning information by allowing different departments to manage their own workers within an organisation-owned multi-tenancy system.
- Deploy quickly and manage users easily by integrating with device management tools (e.g. Mobile Iron, AirWatch).
- Remove risk of unwanted monitoring with an isolated deployment which is fully owned and controlled by customers - (no oversight by Salt Communications).
- Build brand awareness and loyalty with a white labeled secure communications service for specialist customers.
